Nature is full of examples of cycles. The seasons come and go in a cycle of spring, summer, autumn, and winter. The days move in cycles of day and night. And all living things live, grow, and die in cycles. For example, a sapling grows tall and strong. Then, one spring, the tree blossoms. These flowers later turn into fruit or other types of seeds. When these seeds fall, they land on the ground. The seeds can then grow. If the seeds get enough sunlight and rain, they will become young trees. As the trees blossom, the cycle repeats itself.
